**RESEARCH TRENDS IN DISABILITY AND WORK:
A BIBLIOMETRIC ANALYSIS**

The aim of this study is to analyze the status, trends and future research potential areas in the literature about "disability and work". We delve into the content of the papers focused on disability and work published in any journal of a large number of interdisciplinary categories of the Social Science Citation Index during the 1991–2016 period. Bibliometric methods are used to describe the evolution of publication activity, the most representative contributors, the methodologies applied, and the content of the articles in order to explore the main themes researched. For this purpose, an innovative co-word analysis was used, using the technique applied by VOSviewer software, which allows creating knowledge maps based on data from a bibliographic nature to visualize scientific information on a specific research topic. These analyses enable the identification of potential venues for future research that could be meaningful to advance in the consolidation of the discipline.
